

I ask that the current interference laws are NOT changed or relaxed that currently stand on April 29th, 2004.

BPL is here now, but there are petitions to relax the interference laws. Relaxing the interference laws will damage the radio spectrum from 1 through 80 MHZ.

This is important since the power companies do not plan on running Coaxial cable which is shielded. Cable companies have to run shielded Coaxial cable, why should anyone else be allowed to contaminate the radio spectrum by running radio signals on unshielded wire?

I am required to put out a clean signal, so should everyone else.

The amateur radio operators like myself will be blamed when our radio transmissions which are legal, actually interfere with the antenna system(power grid) of the power companies. By interfering with these BPL signals, there is a Homeland Security issue when the signals carry critical data.

Since other technologies are available that are less expensive and better anyway, I ask that the FCC NOT create a problem by relaxing the interference standards of part 15 for BPL.

Thank You
